AUTOMATIC TRANSMISSION

May 12/8

CROSS-REFERENCE TO RELATED APPLICATION

DESCRIPTION
The present application is a United States of America
National Phase, filed under 35 USC 371, of International

AUTOMATIC TRANSMISSION
Application No. , filed , and claims priority
of Japanese Application No. , filed

BACKGROUND OF THE INVENTION

Technical Field

The present invention relates to an automatic
transmission ~~mounted on~~ ^{for} a vehicle and so forth, and more
specifically, it relates to ~~the construction configuration~~
~~of an automatic transmission wherein multiple speed levels~~
~~are made possible by enabling inputting reduced rotation~~ ^{enabled by input of speed}
into one of the rotation components of a planetary gear unit.

Background Art

~~One type of conventional~~
~~Generally, there is known an automatic transmission~~
incorporated ^{into} ~~in a vehicle~~ or the like ~~which~~ comprises a ~~first~~
planetary gear unit with two rows of linked planetary gears, ^{as}
~~a second unit which reduces~~
and planetary gears ~~that can output reduced rotation wherein~~
the rotation ^{at} speed of the input shaft ~~is reduced~~ (for
example, see Japanese Unexamined Patent Application
Publication No. 4-125345). ^{The transmission disclosed in this publication provides} ~~This achieves~~, for example, six
forward speeds and one reverse speed, by ~~enabling~~ input of
~~reduced rotation from the planetary gear~~ ^{speed} ~~via a clutch to,~~ ^{a second unit}
for example, ^{of four} ~~one rotation components of~~ ^{the first} planetary gear unit,
~~that has four rotation components.~~ Further, in the case of
fourth speed forward, for example, when the rotation of the

BEST AVAILABLE COPY

input shaft is input ~~together~~ into two of the rotation ^{ry}
components of the ^{first} planetary gear unit, this fourth speed
forward can be become ^a directly coupled, with ^{state} the output at ^{the output at}
^{rotational speed} same as the input shaft.

The above-described automatic transmission comprises
two clutches for inputting the rotation of the input shaft
into two of the rotation ^{ry} components of the ^{first} ~~mentioned~~
planetary gear unit, and a planetary gear for outputting the
reduced rotation into the rotation ^{ry} components of ~~this~~ ^{the first}
planetary gear unit. However, ~~in the event that~~ ^{if} those two
clutches or the ^{hydraulic} ~~oil~~ servos that control ~~the engaging of~~ ^{their engagement}
~~those clutches~~ are ^{positioned} ~~configured~~ between the ^{first and second} planetary gear
unit ^{element} ~~and the planetary gear~~, the member for transmitting the
reduced ^{speed} rotation of ~~this~~ ^{the second} planetary gear ^{unit a rotary} to the rotation
components of the planetary gear unit ^{first} ~~becomes long in the~~ ^{must be axially elongated}
~~axial direction.~~
^{elongation of the element} ^{speed}
The ~~unit~~ that transmits the reduced rotation ~~becoming~~
~~long~~ means that the unit transmitting ^{that rotation with high} a large torque ~~is~~ ^{must also be}
elongated, and ^{Further, if} ~~an elongated member~~ ^{element must} that can withstand the
large torque ^{it must be fabricated of} requires providing a relatively thick material
~~that is elongated,~~ ^{which} ~~preventing a compact automatic~~ ^{making more}
transmission. ^{because}
Further, ~~the weight of such a member would be~~ ^{increased}
~~heavier, and not only would a lightweight automatic~~ ^{is the objective of}
transmission ~~be prevented,~~ ^{defeated also} but inertia ~~(force of inertia)~~
would increase, reducing the controllability of the

automatic transmission and ^{increasing} shock ⁱⁿ of speed change ~~would~~
~~result more easily.~~

Further, for example, in order to ^{selectively input} ~~engage or disengage~~
the reduced ^{speed} rotation output to the ^{first} planetary gear unit from
the ^{second} planetary gear ^{unit}, a clutch or brake must be provided. In
the case that a clutch is provided, this clutch and the
above-described two clutches, ^{a total of} ~~in other words~~ three clutches,
are necessary. ~~In general,~~ ^{generally} a clutch ^{includes a} has a drum shaped
~~member (clutch drum)~~ that transmits the input rotation to
~~the~~ friction plates, and therefore, for example with a
problem such as relative rotation, ^{supplying} oil pressure to
the oil compartment of the ^{hydraulic} ~~oil pressure~~ servo of the clutch
must be supplied from the mid-section of the automatic
transmission.

^{the aforementioned} However, if ^{arranged in series} those three clutches are ~~configured~~ on one
^{axial} side ~~in the direction of the axis~~ of the planetary gear unit,
for example, ^{the} oil lines for supplying oil pressure to ^{the} three
^{hydraulic} ~~oil pressure~~ servos ^{must be provided} are constructed in triplicate in the
mid-section of the automatic transmission ~~for example,~~ and
the configuration of the oil lines become complicated.

SUMMARY OF THE INVENTION

Accordingly, the object of the present invention is to ~~solve the above~~
^{problems by} providing an automatic transmission with a first clutch that
^{a decelerating} is located between ^{unit an} the planetary gear ^{and} and input shaft ~~and~~
~~the input rotation components,~~ and a brake ~~that is capable~~
^{for} of fixing ^a the rotation ^{axial} fixing components, on one side of the ^{second}

planetary gear unit ~~in the axial direction~~, and with a second clutch and a third clutch on the other ^{axial} side of the ~~second~~ planetary gear unit, ~~in the axial direction, and hence solve the problems mentioned above.~~

~~Disclosure of Invention~~

~~Accordingly,~~ provides
The present invention ~~according to Claim 1 is an~~
automatic transmission comprising: an input shaft that ~~transmits~~
~~rotates based on~~ the output rotation of a drive source; a ~~decelerating first~~ unit ~~reducing~~ planetary gear ^{unit} comprising an input ~~rotary~~
~~component that can input~~ the rotation of the input shaft, an ~~intermediate~~
~~rotation fixing component that fixes the rotation, a reduced~~ decelerated
~~rotary~~ ^{which receives} ~~rotation component that can reduce rotation speed based on rotation~~
~~received from~~ the rotation of the input ~~rotary~~ ^{rotary} component and the ~~intermediate~~
~~rotation fixing component; engaging means for operating the~~ ^{controlling}
rotation of the input ~~rotary~~ ^{rotary} component or ~~the~~ rotation of the ~~intermediate~~ ^{second}
the ~~rotation fixing component; a planetary gear unit~~
comprising ~~first, rotation component and a second, rotation~~
~~component and a third rotation component and a fourth~~
~~rotation component for inputting the reduced rotation of the~~ ^{rotary elements receiving decelerated transmitted from}
~~reduced rotation components; a first clutch for linking the~~ ^{decelerated} ~~input shaft and the second rotation component so as to be~~ ^{selectively connecting}
~~capable of disengaging; a second clutch for linking the~~ ^{rotary element}
~~input shaft and the third rotation component so as to be~~ ^{selectively connecting}
~~capable of disengaging; and an output member for outputting~~ ^{rotary element}

the rotation of the fourth ^{rotary element} ~~rotation component~~ ^{a wheel} into the drive ^{mechanism} ~~wheel transmitting device~~ ^{The automatic transmission of the present invention provides} wherein at least five forward speeds and one reverse speed, ^{are} ~~can be achieved~~ ⁽¹¹⁾ and the first clutch and the second clutch ^{are} ~~can be~~ engaged together ⁱⁿ ~~while~~ ^{first unit} at fourth speed forward, ^{located} ~~and wherein~~ the planetary gear and the engaging means are ^{axial} ~~configured~~ on one side in the axial direction of the ^{second} ~~planetary gear unit~~ ^{while} and wherein the first clutch and the second clutch ^{is located} ~~are configured~~ on the other ^{axial} side in the axial direction of the ^{second} ~~planetary gear unit~~ and wherein the output member is ^{located} ~~disposed~~ between the ^{(1) second unit} ~~planetary gear unit~~ and the ^{(2) decelerating first} ~~reducing~~ planetary gear and the engaging means.

Accordingly, ^{the} ~~an~~ automatic transmission ^{of the present invention} ~~can be~~ provided ^{is} that will achieve at least five forward speeds and one reverse speed with direct coupling ⁱⁿ ~~at~~ fourth speed forward, ^{and} ~~while for example~~, compared to the case wherein two clutches are ^{located} ~~configured~~ between the ^{first and second} ~~planetary gear and the planetary gear unit~~, the ^{located} ~~planetary gear and the planetary gear unit~~ can be ^{located} ~~configured~~ close together, and the transmitting member for transmitting the ^{decelerated} ~~reduced~~ rotation can be made relatively short ^{or}. Therefore, the automatic transmission can be made ^{more} compact and lightweight, and further, because the inertia ^(force of inertia) ~~(force of inertia)~~ can be reduced, the controllability of the automatic transmission ^{is} ~~can be~~ improved, and the occurrence of speed change shock ^{is} ~~can be~~

reduced.

Further, due to the output unit being ^{located} ~~configured in the~~ axial ^{second} ~~direction~~ between the planetary gear unit and the ^{first} ~~speed~~ (reducing) planetary gear ^{unit} and the engaging means, the output unit can be ^{located} ~~configured~~ in approximately the center ^{axial} ~~in the~~ axial direction of the automatic transmission. ^{thus} ~~for example~~, when the automatic transmission is mounted on ^a ~~the~~ vehicle, ^{there is no} ~~need for enlargement in~~ ^{axial} ~~increase in size towards one direction of the axis~~ (particularly ~~in the rear direction when the input side from the drive source is the front direction~~) can be prevented because the output unit is mounted ^{adjacent} ~~to match~~ the drive wheel transmission mechanism. Because of this, particularly in the case of ^a ~~an~~ FF vehicle, ^{with} ~~the~~ interference toward the front wheels is reduced, and the mountability on ^{the} ~~a~~ vehicle can be improved, ^{eg.} ~~such~~ the steering angle ^{is} ~~being~~ greatly improved, ~~for example.~~

The present invention according to Claim 2 is configured such that ~~the engaging means is a first brake capable of fixing the rotation~~ fixing component.

~~The present invention according to Claim 3 is configured such that~~ ^{may be} the engaging means is a first clutch located between the input shaft and the input ^{rotary} ~~rotation~~ component, and ^{for} ~~a first brake capable of fixing the rotation~~ ^{for braking} ~~fixing component.~~ ^{intermediate component}

~~The first clutch is designed to engage at relatively slow to medium speeds.~~

~~Further, three clutches will be configured, but~~

Compared to transmissions
~~compared to the case wherein three clutches are configured~~ *located*
~~on one side of the planetary gear unit, the construction of~~ *in the transmission of the present invention*
~~an oil line to provide oil to the oil pressure servos for~~ *hydraulic design*
~~these clutches can be made easily, and the manufacturing~~
~~process can be simplified and the costs brought down.~~
Further, since the friction member and *3 hydraulic* oil pressure servo of
the third clutch can be made smaller, it can be *located* ~~configured~~
radially ~~on the inner circumference side in the radial direction of~~
the second brake, and the automatic transmission can be made
more compact.

~~The present invention according to claim 4 is~~
~~configured wherein the engaging means is a third clutch~~ *may also be*
located between the input shaft and the input *rotary* rotation
component.

where ~~Further, three clutches will be configured, but~~ *are provided*
~~compared to the case wherein three clutches are configured~~ *located*
~~on one side of the planetary gear unit, the construction of~~
~~an oil line to provide oil to the oil pressure servos for~~ *hydraulic*
~~these clutches can be made easily, and the manufacturing~~
~~process can be simplified, and the costs brought down.~~ *can be*
Further, since the friction member and *5 hydraulic* oil pressure servo of
the third clutch can be made smaller, it can be *located* ~~configured~~
radially inward ~~on the inner circumference side in the radial direction of~~
the second brake, and the automatic transmission can be made
more compact.

In one embodiment
The present invention ~~according to Claim 5~~ *also includes* comprises a second brake ~~capable of~~ *for* fixing the first ~~rotation component~~ *rotary element which receives* ~~wherein the reduced rotation is input~~ *input as decelerated* ~~wherein the second~~ *include* brake and the third clutch each ~~comprise a~~ friction members and ~~an oil pressure~~ *a hydraulic* servo for ~~pressing~~ *engaging* the friction member ~~and wherein the friction member of the third clutch is~~ *is* located ~~disposed on the inner circumference side in the~~ *radially outward* ~~direction of the friction member of the second brake.~~

No 9 → Accordingly, the third clutch is between the input shaft and input ~~rotation component~~ *rotary*, whereby the load on the third clutch can be reduced as compared to arrangements wherein, for example, the third clutch is between the input ~~rotation component~~ *rotary* and first ~~rotation component~~ *rotary element*, and ~~therefore,~~ *Therefore,* the third clutch can be made more compact, so the friction member ~~of the third clutch and the oil servo thereof~~ *its hydraulic servo* can be reduced ~~in~~ *in* size, allowing ~~placement~~ *location* on the ~~inner circumference side in the radial direction~~ *radially* of the second brake, thereby enabling ~~making~~ *to be made* the automatic transmission more compact.

~~With the present invention according to Claim 6, The~~ *may be located* ~~third clutch is configured between the~~ *first* ~~(reducing) planetary gear~~ *unit* and the output member, ~~wherein~~ *with* the drum member of the third clutch ~~is configured so as to open~~ *ing* toward the ~~reducing planetary gear.~~ *first*

may also include
The present invention ~~according to Claim 7~~ is

~~configured comprising~~ a linking unit for linking the ~~decelerating~~ ^(or "member") ~~reduced rotation component~~ and the first ~~rotation component~~ ^{rotary element, with} wherein the third clutch ^{located radially} ~~is configured~~ on the inner ~~circumference~~ side of the linking unit.

~~With the present invention according to Claim 8, The~~ ^{hydraulic} oil pressure servo of the third clutch ^{preferably located} is ~~configured~~ on the input shaft, ~~so as to communicate~~ ⁱⁿ with an oil path ^{ion} ~~provided~~ ^{extending} ~~from~~ ^{through} the case ~~via~~ ⁱⁿ an oil path ~~provided~~ ^{to} the input shaft.

~~With the present invention according to Claim 9, The~~ ^{includes} third clutch comprises a friction member ³ and ~~an oil pressure~~ ^{a hydraulic} servo for ~~pressurizing~~ ^{engaging the} this friction member ³, wherein the ~~oil~~ ^{hydraulic} pressure servo is ~~configured~~ ^{axially located} on the ~~opposite~~ ^{opposite the first} side of the ~~friction members~~ ^{unit} (reducing) planetary gear ^{unit} in the axial direction ~~as to the~~ ^{decelerating} ~~friction member~~ ^{The} and wherein a drum member ~~constructing a~~ ^{hydraulic} cylinder of this ~~oil pressure~~ ^{to} servo is linked with the input shaft.

~~The present invention according to Claim 10 is~~ ^{may be axially located} configured with ~~the first brake~~ ^{second} configured on the ~~opposite~~ ^{same} side in the axial direction of the ~~planetary gear unit~~ ^{of} ~~the reducing planetary gear~~ ^{first} ~~unit~~ ^{unit} wherein the ~~oil pressure~~ ^{with its hydraulic} servo ~~of the first brake is provided~~ ^{formed in} to the case.

The present invention ~~according to Claim 11 is~~ ^{preferably also includes} ~~configured comprising~~ a second brake ^{for} capable of fixing the ~~first rotation component~~ ^{rotary element which receives input of} wherein the reduced rotation ~~is~~ ^{speed} ~~input~~ ^{in such embodiments} wherein the first brake and the second brake each

~~include~~ ^{a hydraulic} ~~comprise~~ a friction member and an oil pressure servo for ~~engaging~~ pressing the friction member, ^{hydraulic} ~~and wherein, the oil pressure~~ ^{may be located} ~~servo of the first brake is configured on the inner~~ ^{radially inward} ~~circumference side in the radial direction~~ ^{hydraulic} ~~of the oil~~ ~~pressure servo of the second brake, and the friction member~~ ^{ing} ~~of the first brake meshes with a member extended from~~ ^{hydraulic} ~~between the oil pressure servo of the first brake and the~~ ^{hydraulic} ~~oil pressure servo of the second brake.~~

^{In embodiments wherein} ~~The present invention according to Claim 12 is~~ ^{in provided to fix} ~~configured comprising a second brake capable of fixing the~~ ^{rotary element against rotation,} ~~first rotation component wherein the reduced rotation is~~ ^{may be located radially} ~~input, wherein the engaging means is configured in a~~ ^{inward} ~~location so as to wrap in the radial direction on the inner~~ ~~circumference side of the second brake.~~

~~The present invention according to Claim 13 is~~ ~~configured such that the first clutch is a clutch that~~ ~~engages at a relatively slow to medium speed level.~~

~~Accordingly, When this~~ ^{The} ~~first clutch is released at a~~ ~~relatively high speed level or at the reverse speed level,~~ ⁱⁿ ~~with~~ ^{rotary element} ~~particularly the unit connecting this first clutch and~~ ~~second rotation component result in rotating at a relatively~~ ^{the} ~~high rotation or reverse rotation, while there may be cases~~ ^{speed} ~~wherein the transmitting member that transmits the reduced~~ ^{decelerated} ~~rotation from the planetary gear reduces rotation speed or~~ ^{First} ~~is fixed, and some cases may occur wherein the revolution~~ ^{unit is rotating at a reduced} ~~between the first clutch and the transmitting member.~~ ^{there is a large difference in rotational speed}

~~the~~
~~difference thereof may be large.~~ However, because ~~this~~
~~first clutch is located on the opposite side of the second~~
~~planetary gear via the planetary gear unit, that is to say,~~
~~the unit with a relatively high rotation or reverse~~
~~rotation and a unit with a reduced rotation (particularly~~
~~the linking member) can be configured apart, and compared~~
~~with the case wherein for example those units are configured~~
~~in contact with a multi-axial construction, the decreased~~
~~efficiency of the automatic transmission resulting from the~~
~~relative rotation between the members can be prevented.~~

~~The~~
~~With the present invention according to Claim 14, the~~
~~first clutch comprises a friction member, an oil pressure~~
~~servo that pressurizes this friction member, a drum unit~~
~~that is constructed integrally with the oil pressure servo,~~
~~and a hub unit, and the drum unit is linked with the input~~
~~shaft, and the hub unit is linked with the second rotation~~
~~element component.~~

~~The present invention according to Claim 15 is~~
~~configured such that the linking member that links the~~
~~reduced rotation component of the planetary gear and the~~
~~first rotation component of the planetary gear unit, are~~
~~mutually linked passing through the inner circumference of~~
~~the output member.~~

~~The present invention according to Claim 16 further~~
~~comprises a differential unit for outputting rotation to~~

driving wheels, and a counter shaft unit ~~for~~ ^{ed with} engaging the differential unit, wherein the output member is a counter gear meshing with the counter shaft unit.

~~The present invention according to Claim 17 is configured such that wherein, in a speed line chart illustrating the revolutions of the first, second, third, and fourth rotation components with the vertical axis, and the gear ratio of the first, second, third, and fourth rotation components with the horizontal axis in a corresponding manner; the first rotation component to which the reduced rotation is input is positioned at the farthest edge in the horizontal direction, with the third rotation component, the fourth rotation component linked to the output member, and the second rotation component, corresponding in that order.~~

~~The present invention according to Claim 18 is configured such that the planetary gear unit is a multiple type planetary gear, comprising a first sun gear, a long pinion which meshes with the first sun gear, a short pinion which meshes with the long pinion, a carrier for rotationally supporting the long pinion and the short pinion, a second sun gear meshing with the short pinion, and a ring gear meshing with the long pinion.~~ ^{second preferably}
~~wherein the first rotation component is the first sun gear capable of receiving input of the reduced rotation of the reduced rotation~~ ^{unit including}
~~of the reduced rotation of the reduced rotation~~ ^{In such an embodiment}
~~of the reduced rotation of the reduced rotation~~ ^{rotary element}
~~of the reduced rotation of the reduced rotation~~ ^{of decelerated from decelerated rotary component}

output means, and which ^{is} ~~is~~ capable of being fixed by the retaining of the second brake; and wherein the second ~~rotation component~~ ^{rotary element} is the second sun gear ^{for receiving} capable of inputting ^{as} rotation of the input shaft by the engaging of the first clutch; and wherein the third ~~rotation component~~ ^{rotary element} is the carrier ^{receiving} capable of inputting the rotation of the input shaft by the engaging of the second clutch, and which is capable of being fixed by the ^{engagement} ~~retaining~~ of a third brake; and wherein the fourth ~~rotation component~~ ^{rotary element} is the ring gear linked to the output member.

In operation, preferably
~~The present invention according to claim 19 is~~
~~configured wherein, in the first speed forward, the first~~
~~clutch is engaged and the third brake is retained; and~~
~~wherein, in the second speed forward, the first clutch is~~
~~engaged and the second brake is retained; and wherein, in~~
~~the third speed forward, reduced rotation is input to the~~
~~first rotation component from the reduced rotation output~~
~~means, and the first clutch is engaged; and wherein, in the~~
~~fourth speed forward, the first clutch and the second clutch~~
~~are both engaged; and wherein, in the fifth speed forward,~~
~~reduced rotation is input to the first rotation component~~
~~from the reduced rotation output means, and the second~~
~~clutch is engaged; and wherein, in the sixth speed forward,~~
~~the second clutch is engaged and the second brake is~~
~~retained; and wherein, in the first speed reverse, reduced~~

rotation is input to the first ^{rotary element} ~~rotation component~~ from the ^{decelerated rotary component} ~~reduced rotation output means~~, and the third brake is ^{engaged} ~~retained~~; whereby six forward speed ⁵ ~~levels~~ and one reverse speed ~~level~~ can be achieved.

DESCRIPTION OF THE PREFERRED EMBODIMENTS

~~Best Mode for Carrying Out the Invention~~

~~First Embodiment~~

^{as}
^A The first embodiment ~~relating to~~ the present invention will be described ^{with reference to} following Fig. 1 through Fig. 3 below.

~~Fig. 1 is a schematic cross sectional diagram illustrating the automatic transmission device of an automatic transmission relating to the first embodiment, Fig. 2 is a operational table of an automatic transmission relating to the first embodiment, and Fig. 3 is a speed line diagram of an automatic transmission relating to the first embodiment.~~

^{The} ~~An automatic transmission relating to~~ the first embodiment ^{of} ~~according to~~ the present invention ~~has an~~ ~~automatic transmission device 1,~~ as illustrated in Fig. 1 ~~11~~. ~~This~~ is particularly favorable for an FF (front engine, front wheel drive) vehicle, and has a ^{torque converter} ~~case~~ comprising a housing ~~case~~, not illustrated, and a transmission case 3, and ^{the torque converter} ~~within this housing case~~ is configured a torque converter, not illustrated, ^{The} ~~within this transmission case 3~~ ^{houses} ~~is configured~~ an automatic transmission ~~device 1,~~ a counter shaft unit (drive wheel transmission mechanism), not illustrated, and a differential unit (drive wheel transmission mechanism).

~~The~~ ^{arranged} This torque converter is ~~configured~~, for example, ^{with its} ~~on~~
~~the axis that is centered on an~~ input shaft 2 of the
automatic transmission ~~device~~ 1₁, which is on the same axis
as the output shaft of the engine (not illustrated), and
~~the~~ ^{also centered} this automatic transmission ~~device~~ 1₁ is ~~configured on the~~ ^{axis of the engine}
~~output shaft, of this engine, in other words, the axis that~~
~~is centered on the input shaft 2.~~ ^{HP} Further, ^T the above-
mentioned counter shaft unit ^{includes} ~~is configured on~~ a counter
shaft (not illustrated) ^{with its} ~~on an axis that is~~ ^{arranged} parallel to the
input shaft 2, and the above-mentioned differential unit ~~is~~
~~configured so as to have a lateral axle, not illustrated, on~~ ^{arranged}
^{with its} ~~an axis that is~~ ^{that of the} parallel to this counter shaft.

~~The~~
~~Next, the automatic transmission device~~ 1₁ of the
~~automatic transmission relating to the first embodiment will~~ ^{now}
be described ⁱⁿ with reference to Fig. 1. As illustrated in
Fig. 1, the automatic transmission ~~device~~ 1₁ comprises a
^{front (second)} planetary gear unit PU and a ^{rear (first)} planetary gear ^{unit} VPR on the input
shaft 2. ^{The front} This planetary gear unit PU is a multiple-type
planetary gear ^{unit}, which has a sun gear S2 (the second rotation
^{element} component), a carrier CR2 (the third rotation ^{ry element} component), a
ring gear R3 (the fourth rotation ^{ry element} component), and a sun gear
S3 (the first rotation ^{ry elements} component), as the four rotation ^{ry}
~~components, wherein~~ ^{elements.} the carrier CR2 has a long pinion PL
that meshes with a sun gear S3 and a ring gear R3, and a
short pinion PS that meshes with a sun gear S2, ^{Pinions PL and PS} which are

meshed ^{with} ~~to~~ one another. ~~Further, the above mentioned~~
planetary gear ^{unit} VR is a double planetary gear ^{unit which includes} that has a
carrier (^{intermediate} ~~rotation fixing~~ component) CR1, wherein a pinion Pb ^{which}
meshes with a ring gear (reduced ^{speed rotary} ~~rotation~~ component) R1 and
a pinion Pa ^{which} meshes with a sun gear (input rotation ^{rx}
component) S1, ^{Pinions Pa and Pb} which are meshed one to another.

~~On the above mentioned input shaft 2 is configured a~~
~~oil pressure servo 13, a friction plate 73, a drum-shaped~~
~~member 25 that forms a clutch drum, and a multi-disc clutch~~
C3 (the third clutch) ^{which includes} that comprises a hub unit 26, ^{are arranged}
^{centered on the input shaft 2.} ~~This oil pressure servo 13 is constructed from a piston~~
^{The hydraulic engaging} unit b for pressurizing the friction plate 73, a drum-shaped
member 25 that has a cylinder unit e, an oil chamber "a"
^{as a space} which is formed ^{by seal rings f and g} by sealing between this piston unit b and
~~this cylinder unit e with seal rings f and g, a return~~
^{biases} spring c that ~~energizes~~ this piston unit b towards ^{the} this oil
chamber "a", and a return plate d that ^{bears force} ~~absorbs~~ the energy of
^{the} this return spring c.

^{The other hydraulic}
~~Now, for the following descriptions, each oil pressure~~
^{are} servo ⁵ shall be considered as being ^{are} constructed similarly
^{having} from an oil chamber "a", ² the piston unit b, ~~the~~ return
spring c, ~~the~~ return plate d, ~~the~~ cylinder unit e, and ~~the~~
seal rings f and g, and ^{therefore} ~~as such~~, description thereof will be
omitted.

^{hydraulic}
The oil chamber "a" of this oil pressure servo 13 is

connected to an oil line 2a which is formed ⁱⁿ on the input shaft 2, and this oil line 2a is ~~provided along one edge of~~ the case 3, and is connected to an oil line 92 ^{of case 3} of a boss ^{forms a sleeve around} unit 3a which is ~~formed on this input shaft 2 in sleeve form.~~ Further, this oil line 92 ² is connected to an oil pressure control unit, not illustrated. ^{Thus} In other words, because the ^{hydraulic} above-mentioned oil pressure servo 13 is ^{arranged} configured on input shaft 2, an oil ^{path} line from the oil pressure control unit, ~~not illustrated,~~ to the oil chamber "a" of the oil pressure servo 13 is constructed ² simply by providing one set of seal rings 81 ~~to seal between this boss unit 3a and the input shaft 2.~~

Further, ~~The above-mentioned~~ input shaft 2 is connected to the ~~above-mentioned~~ drum-shaped member 25, and on the ^{having an} front edge of the inner circumference side of this drum ^{trial surface} shaped member 25 is ^{to which} configured the friction plate 73 of the clutch C3 which is ^{are} capable of engaging by the oil pressure servo 13 for the clutch C3, by being splined, and is ~~connected with the inner circumference side of the friction plate 73 of this clutch C3 splined to the hub unit 26, which~~ ^{are intermesh with friction plates} Further, this hub unit 26 is connected to the ~~above-mentioned~~ sun gear S1. Further, the ^{supports} carrier CR1 has the pinion Pa and the pinion Pb, and this ^{ring} pinion Pb meshes with the ~~above-mentioned~~ ring gear R1, and this pinion Pa meshes with the sun gear S1 which is connected to the input shaft 2.

The carrier CR1 is secured to the boss ~~unit~~ 3a of the case 3 via a side plate, and the ring gear R1 is supported by ~~supporting unit 31~~ ^{for free rotation} to the boss ~~unit~~ 3a ^{through member 31.} so as to freely rotate.

On the outer circumference ^{t.21} side of this ring gear R1 is configured a multi-disc brake B1 (the second brake) that ~~includes a hydraulic~~ ^{includes a hydraulic} comprises an oil pressure servo 14, a friction plate ⁷⁴, and a hub unit 29. ^{The friction plates 74 are intermeshed with plates splined to} and on the outer circumference ^{surface} side of the hub unit 29, ~~is disposed the friction plate 74 of the brake~~ B1 which is capable being retained by the oil pressure servo 14 of the brake B1, by being splined. ^{The} Also, this hub unit 29 is connected to ~~this~~ ring gear R1, and is ~~also~~ connected ^{at its other} ^{axial end} to a transmitting member 30 that transmits the rotation of the ring gear R1 when ~~this~~ clutch C3 is engaged, ^{that, in turn,} and ~~on the~~ ^{is connected to} other side of this transmitting member 30 the sun gear S3 of the ^{second} ~~above-mentioned~~ planetary gear unit PU ~~is connected~~. In other words, the ring gear R1 and the sun gear S1 are constantly ^{connected} ~~in contact~~ with one another, with no clutch located between, and ^{is} the rotation can constantly be ^{between S1 and R1} transmitted.

^{AT the front end} ~~On the other hand, on the other edge~~ of the input shaft 2 (left side of diagram) ^{is} a multi-disc clutch C1 (the first clutch) ^{includes a hydraulic} ~~is configured that comprises an oil pressure servo~~ 11, ²¹ friction plate ⁷¹, a drum shaped member 21 that forms a clutch drum, and a hub ~~unit~~ 22. ^A Further, ~~on the boss unit~~

between the boss ~~unit~~ 3b of the case 3 and the drum ~~shaped~~
~~member~~ 23.

The drum ~~shaped member~~ 21 of the ~~above mentioned~~ clutch
C1 is connected to the input shaft 2, ~~and on the front edge~~
~~of the inner circumference side of this drum shaped member~~
~~21 is configured a friction plate 71.~~ ^{has} The clutch C1 ~~that~~
~~is capable of engaging by the oil pressure servo 11, for the~~
~~clutch C1, splined.~~ ^{an} ^{to} ^{on the front edge}
~~On the inner circumference side of the~~ ^{friction plate 71}
~~The friction plate 71 of this clutch C1 is configured a hub unit~~
~~22, splined, and this hub unit 22 is connected to the sun~~
~~gear S2.~~ ^{are intermeshed with plates splined to}

The drum ~~shaped member~~ 23 of the ~~above mentioned~~ clutch
C2 is also connected to the input shaft 2, ~~and on the front~~
~~edge of the inner circumference side of this drum shaped~~
~~member 23 is configured a friction plate 72 of the clutch C2~~
~~that is capable of engaging by the oil pressure servo 12, for~~
~~the clutch C2, by being splined.~~ ^{has} ^{an} ^{on the front edge}
~~On the inner circumference~~ ^{friction plate 72}
~~side of the friction plate 72 of this clutch C2 is~~
~~configured a hub unit 24 by being splined, and this hub unit~~
~~24 is connected to the carrier CR2.~~ ^{are intermeshed with plates splined to}
^{which}
~~On the other hand,~~ ^{radially} ^{second} ^{On the outer circumference side of}
~~the planetary gear unit PU is configured a multi-disc brake~~
~~B2 that has an oil pressure servo 15, a friction plate 75,~~
~~and a hub unit 28.~~ ^{includes a hydraulic}
~~To the side plate of the carrier CR2 of~~
~~this planetary gear unit PU is connected a hub unit 28 that~~ ^{An end} ^{to}

intermeshed with friction plates

is splined to ~~the~~ friction plate 75 of the ~~above mentioned~~
brake B2, and ~~further~~ this hub ~~unit~~ 28 is connected to the
inner race of a one-way clutch F1. The sun gear S2 is
meshed with the short pinion PS of ~~this~~ carrier CR2, and the
~~above mentioned~~ sun gear S3 and ring gear R3 are meshed with
the long pinion PL of ~~this~~ carrier CR2. Also, a linking
~~member~~ unit 27 is connected to one ~~edge~~ ^{end} of ~~this~~ ring gear R3, and ~~links~~
~~this~~ ring gear R3 ^{is} ~~is linked~~ to the counter gear (output)
unit 5, ~~via this linking unit 27.~~

As described above, the planetary gear PR and the
clutch C3 are ~~configured on one side in the direction of the~~
~~axis~~ of the planetary gear unit PU, and ~~also~~ the clutch C1
and the clutch C2 are ~~configured on the other side in the~~
~~direction of the axis~~ ^{arranged at axial} ~~of~~
~~planetary gear unit PU.~~ ^{2nd} ~~located axially~~ ^{unit} ~~configured between the planetary gear PR and the planetary~~
~~gear unit PU, in the direction of the axis.~~ ^{first} ~~Further, the counter gear 5 is,~~ ^{second}
~~configured between the planetary gear PR and the planetary~~
~~gear unit PU, in the direction of the axis.~~ ^{located} ~~Further, the~~
~~brake B1 is configured on the outer circumference side of~~
~~the planetary gear, and the brake B2 is configured on the~~ ^{located} ~~outer circumference side of the planetary gear unit PU.~~ ^{radially}

~~Continuing, based on the above-mentioned construction,~~
~~the~~ ^{Operations} of the automatic transmission ~~device~~ 1, will now
be described, ^{with reference to} ~~following~~ Fig. 1, Fig. 2, and Fig. 3, ~~below~~
~~Now,~~ ⁴⁵ ~~The vertical axis of the speed line diagram illustrated~~
~~in Fig. 3 indicate the revolutions of each rotation~~
~~element~~ ^{component}, and the horizontal axis indicates the

corresponding gear ratio of these ~~rotation~~ ^{rotary elements} components.

~~Further, regarding the planetary gear unit PU section of~~ ^{In second} this speed line diagram, the vertical axis ^{on} ~~to the farthest~~ ~~horizontal edge~~ (the right side of Fig. 3) corresponds to sun gear S3, and ~~hereafter~~ moving to the left ~~direction~~ within the diagram, the vertical axis ^e ~~corresponds~~ ^{in succession,} to the carrier CR2, the ring gear R3, and the sun gear S2. ~~Further,~~ ^{On first} ~~regarding the planetary gear PR section of this speed line~~ ^{unit} diagram, the vertical axis ^{on} ~~to the farthest horizontal edge~~ (the right side of Fig. 3) corresponds to sun gear S1, and ~~hereafter~~ moving to the left ~~direction~~ within the diagram, the vertical axis ^{in succession,} corresponds to the ring gear R1 and the carrier CR1. Further, the width between these vertical axes are ^{proportional to the inverse of} ~~proportional to the inverse of~~ the number of teeth of ^{1) to} ~~each of the sun gears S1, S2, S3, and to the inverse of the~~ ^{proportional to} number of teeth ~~of each of the ring gears R1, R3. Also, The~~ ^{1) of} dotted line ~~in a horizontal direction~~ within the diagram illustrate ^{that the rotation is} transmitted from the transmitting member 30.

As illustrated in Fig. 1, the rotation of input shaft 2 is input to the ~~above mentioned~~ sun gear S2, by engaging ^{ement of} the clutch C1. The rotation of input shaft 2 is input to the ~~above mentioned~~ carrier CR2, by engaging ^{ement of} the clutch C2, and this carrier CR2 can ^{be held against} ~~fix the rotation by the~~ ^{engagement} ~~obtaining of~~ brake B2, and ^{is limited to} ~~therefore~~ the rotation in one direction is

regulated by the one-way clutch F1.

~~On the other hand, the above-mentioned~~ ^{The} sun gear S1 is ^{element of} connected to the input shaft 2 by engaging the clutch C3. ^{for receipt of} ~~and the rotation of this input shaft 2 is input.~~ Further, the ~~above-mentioned~~ carrier CR1 is connected to the case 3 ^{thereby fixed against} and ^{so that} the rotation thereof is fixed, and then the rotation of the input shaft 2 ^{the} is input to ^{causes} the sun gear S1, the ring gear R1 ^{to} therefore rotates at a reduced speed. The reduced speed rotation of this ring gear R1 is input to the sun gear S3 via the transmitting member 30. Further, when the clutch C3 is not engaged, and the brake B1 is ^{engaged:} retained, the rotation ^{against rotation} of the sun gear S3 is fixed via this transmitting member 30.

~~Also, The rotation of the above-mentioned ring gear R2~~ ^{R3} is output to the above-mentioned counter gear 5, and ~~is from the counter~~ ^{gear 5} ~~output to the drive wheel not illustrated via this counter~~ ^{via} gear 5, a counter shaft unit, not illustrated, and a differential unit. ^{To}

^{In} ~~At~~ first speed forward within the D (drive) range, as illustrated in Fig. 2, the clutch C1 and ~~a~~ one-way clutch F1 are engaged. Then, as illustrated in Fig. 3, the rotation of input shaft 2 is input to the sun gear S2 via the clutch C1, and the rotation of the carrier CR2 is ^{restricted to} regulated in one direction (the forward rotation direction), in other words, the carrier CR2 is ^{ed} prevent from rotating in the opposite direction ~~and is fixed~~. Further, the rotation of input

shaft 2 that is input to the sun gear S2 is output to the ring gear R3 via the fixed carrier CR2, and the forward rotation for first speed forward is output from the counter gear 5.

~~Now~~ ^{engaged} When downshifting (when coasting), the brake B2 is ^{thereby} ~~retained~~ and carrier CR2 is fixed, and ~~the above mentioned state of first speed forward is maintained, while preventing the forward rotation of this carrier CR2~~. Further, ⁱⁿ at this first speed forward, the one-way clutch F1 prevents the carrier CR2 from rotation in the opposite direction and allows forward rotation, and therefore, switching from a non-running range to a running range and achieving the first speed forward can be accomplished more smoothly by the automatic ^{ement} ~~engaging~~ of the one-way clutch.

^{In} ~~At~~ second speed forward within ~~the~~ D (drive) range, as illustrated in Fig. 2, the clutch C1 is engaged and the brake B1 is ^{also engaged} ~~retained~~. Then, as illustrated in Fig. 3, the rotation of input shaft 2 is input to the sun gear S2 via the clutch C1, and the sun gear S3 is fixed by ^{engagement of} ~~retaining~~ the brake B1. ^{In this state} ~~By doing so,~~ the carrier CR2 slightly reduces ^{the} rotation ^{2/} speed, ~~and~~ the rotation of input shaft 2 that was input ^{to} ~~in~~ the sun gear S2 is output to the ring gear R3 via the carrier CR2 at this reduced rotation, ^{speed} and the forward rotation for second speed forward is output from the counter gear 5.

In
At third speed forward within the D (drive) range, as illustrated in Fig. 2, the clutch C1 and the clutch C3 are engaged. Then, as illustrated in Fig. 3, the rotation of input shaft 2 is input to the sun gear S2 via the clutch C1. Further, ^{also} the rotation of input shaft 2 is input to the sun gear S1 via the clutch C3, ~~and the ring gear R1 reduces the~~ rotation speed ^{due to non-rotation of the} ~~by the fixed carrier CR1, and the~~ ^{reduced} speed ~~reduction speed rotation~~ of this ring gear R1 is output to the sun gear S3 via the transmitting member 30. Then, the carrier CR2 ^{will have} has a slightly increased ~~reduced~~ rotational ^{speed} compared to the ~~reduced~~ ^{speed} rotation of this sun gear S3 because of the rotation of the input shaft 2 input to the sun gear S2 and the ^{speed} reduced rotation of the sun gear S3. Further, the rotation of the input shaft 2 ~~that was~~ ^{to} input in the sun gear S2 is output to the ring gear R3 via the carrier CR2 at ~~this~~ ^{the} reduced rotation, ^{speed} and the forward rotation for third speed forward is output from the counter gear 5. In this case, because the sun gear S3 and the ring gear R1 ^{rotate} are at a reduced ^{speed} rotation, the ~~above-mentioned~~ transmitting member 30 ^{transmits} ~~performs a relatively large torque transmission.~~

In
At fourth speed forward within the D (drive) range, as illustrated in Fig. 2, the clutch C1 and the clutch C2 are engaged. Then, as illustrated in Fig. 3, the rotation of the input shaft 2 is input to the sun gear S2 via the clutch C1, and into the carrier CR2 via the clutch C2 ^{to establish} ~~Therefore,~~

~~by the rotation of the input shaft 2 input to the sun gear S2 and the rotation of input shaft 2 input to the carrier CR2, in other words, in the state of directly coupled rotation, and the rotation of the input shaft 2 is output as is to the ring gear R3, and the forward rotation for fourth speed forward is output from the counter gear 5.~~

~~In~~ At fifth speed forward within the D (drive) range, as illustrated in Fig. 2, the clutch C2 and the clutch C3 are engaged. Then, as illustrated in Fig. 3, the rotation of the input shaft 2 is input to the carrier CR2 via the clutch C2 ~~and~~ ~~Further, the rotation of the input shaft 2 is input to the sun gear S1 via the clutch C3, and the ring gear R1 rotates at a reduced rotation speed by the fixed carrier CR1, and the reduced rotation of this ring gear R1 is output to the sun gear S3 via the transmitting member 30. Then, overdrive rotation due to reduced rotation of the sun gear S3 and the carrier CR2 wherein the rotation of the input shaft 2, is input, is output to the ring gear R3, and the forward rotation for fifth speed forward is output from the counter gear 5. In this case, similar to the case of the above mentioned third speed forward, because the sun gear S3 and the ring gear R1 are at a reduced rotation, the above mentioned transmitting member 30 performs a relatively large torque transmission.~~

at this reduced speed

the speed input to

of

rotating speed transmits

~~In~~ At sixth speed forward within the D (drive) range, as

illustrated in Fig. 2, the clutch C2 is engaged and the brake B1 is ~~retained~~ ^{engaged}. Then, as illustrated in Fig. 3, the rotation of the input shaft 2 is input to the carrier CR2 via the clutch C2, and the sun gear S3 is fixed by ~~retaining~~ ^{engagement} ~~of~~ with the brake B2. This causes overdrive rotations ~~(over~~ ^{at a speed higher} greater than that of the above-mentioned fifth speed forward, ^{derived} from the rotation of the input shaft 2 input to the carrier CR2 ^{with} and the ~~fixed~~ ^{fixed} sun gear S3, ^{fixed to be} and is output to the ring gear R3, and the forward rotation for sixth speed forward is output from the counter gear 5.

^{In} At first speed reverse within ~~an~~ R (reverse) range, as illustrated in Fig. 2, the clutch C3 ~~is engaged~~ and the brake B2 ~~is retained~~ ^{are engaged}. Then, as illustrated in Fig. 3, the rotation of the input shaft 2 is input to the sun gear S1 via the clutch C3, and the ring gear R1 ^{rotates at a} decreased speed ^{with} rotation by the ~~fixed~~ carrier CR1, and the ~~reduced~~ rotation of this ring gear R1 is output to the sun gear S3 via the transmitting member 30. Further, the carrier CR2 is fixed by ~~retaining~~ ^{engagement of} with the brake B2. Then, the ~~reduced~~ rotation ^{at reduced speed with} of the sun gear S3 ^{reverse} and the ~~(fixed~~ carrier CR2) is output to the ring gear R3 as ~~an opposite~~ ^{reverse} direction rotation, and the ~~opposite~~ ^{reverse} direction rotation for first speed reverse is output from the counter gear 5. In this case, similar to the case ⁵ of the ~~above-mentioned~~ ^{and} third speed forward or fifth speed forward, because the sun gear S3 and the ring gear R1

are ^{rotating} at a reduced ^{speed} rotation, the ~~above mentioned~~ transmitting member 30 ^{transmits} ~~performs~~ a relatively large torque ~~transmission~~.

^{In} At the P (parking) range and ~~the~~ N (neutral) ~~range~~, particularly the clutch C1, clutch C2, and clutch C3 are released, ~~the transmission movement~~ between the input shaft 2 and the counter gear 5 is disconnected, and the automatic transmission ~~device~~ 1₁ as a whole is in an idle state (neutral state).

^{Now} As illustrated in Fig. 2 and Fig. 3, ⁱⁿ at first speed forward, second speed forward, fourth speed forward, and sixth speed forward, ⁱⁿ at the planetary gear PR, the rotation of the sun gear S3 is input to the ring gear R1 via the transmitting member 30, and further, because the clutch C3 is released, as illustrated in Fig. 3, the sun gear S1 ^W rotates based on the rotation of ~~each speed level of this~~ ring gear R1 and the fixed ^{state of} carrier CR1.

As described above, ⁱⁿ according to the automatic transmission ~~device~~ 1₁ ^{of} relating to the present invention, the planetary gear PR and the clutch C3 are ^{arranged} ~~configured~~ on one ~~side in the axial~~ direction of the planetary gear unit PU, and the clutch C1 and the clutch C2 are ^{arranged} ~~configured~~ on the other ^{axial} ~~side in the axial~~ direction of the planetary gear unit PU, ^{and the} therefore an automatic transmission can ~~be~~ provided ~~that will achieve~~ six forward speeds and one reverse speed with direct coupling ⁱⁿ at fourth speed forward. For example,

compared to ~~the case~~ ^{a transmission} wherein the clutch C1 or clutch C2 is ~~located~~ ^{located} ~~configured~~ ^{first unit second} between the planetary gear VPR and the planetary gear unit PU, the ~~planetary gear VPR~~ ^{first unit second} and the planetary gear unit PU can be ~~configured~~ ^{located} close together, and the transmitting member 30 ~~for~~ ^{which} transmitting ~~the~~ ^{speed} reduced rotation can be made relatively short. ^{or more} Therefore, the automatic transmission can be made ~~compact~~ ^{compact} and lightweight, and further, because the inertia ~~(force of inertia)~~ ^{inertial} can be reduced, the controllability of the automatic transmission can be improved, and the occurrence of speed change shock can be reduced.

Further, the clutch C3 is ~~configured~~ ^{located} on one ~~side~~ ^{axial} ~~in the~~ ^{second} axial direction of the planetary gear unit PU, and the clutch C1 and the clutch C2 are ~~configured~~ ^{located} on the other ~~side~~ ^{axial} ~~in the axial direction~~ ^{second} of the planetary gear unit PU.

Therefore, compared to the case wherein for example three clutches C1, C2, and C3 are ~~configured~~ ^{arranged} on one side of the ~~planetary gear unit PU~~ ^{second}, the construction of ~~an~~ ^{oil line} (for example, 2a, 2b, 92, 93, 94) ~~to provide~~ ^{for} oil to the ~~oil~~ ^{hydraulic} pressure servos 11, 12, and 13 for these clutches C1, C2, C3 ~~can be made easily, and~~ ^{becomes easier} the manufacturing process ~~can be~~ ^{is} simplified and the costs ~~brought down.~~ ^{reduced}

Further, because the ~~oil pressure~~ ^{hydraulic} servos 11 and 13 are provided on the input shaft 2, ~~one set~~ ^{two} of seal rings 81 and 82 seal the case 3 ~~and supply oil~~ to the oil lines 2a and

2b provided within input shaft 2, and therefore oil can be supplied to the oil compartment of ~~oil pressure~~ ^{hydraulic} servos 11 and 13 without providing seal rings between, for example, the input shaft 2 and the ~~oil pressure~~ ^{hydraulic} servos 11 and 13. Further, ~~oil pressure~~ ^{the hydraulic} servo 12 can ^{be supplied with} supply oil from the boss ~~unit 3b provided from the case 3,~~ without passing through other units for example, ~~in other words, can supply oil by~~ ^{provision of the} providing one set of seal rings 83. Therefore, oil can be supplied simply by providing one set of seal rings 81 and 82, 83 each for the oil pressure servos 11, 12, and 13, and ~~because~~ ^{is} sliding resistance from the seal rings ~~can be~~ ^{is} minimized, and ~~therefore~~ ^{is} the efficiency of the automatic transmission ~~can~~ ^{is} be improved.

~~Further,~~ ^T the clutch C1 is a clutch that engages at relatively slow to medium speed ^{s, i.e. in} levels of first speed forward, second speed forward, third speed forward, and fourth speed forward, and ~~therefore then this clutch C1 is~~ released at fifth speed forward, sixth speed forward, or first speed reverse, which are relatively high speed ^s levels. ~~The hub unit 22 that connects in particular this clutch C1~~ and sun gear S2 rotates at a relatively high ^{speed} rotation or ⁱⁿ reverse rotation (see Fig. 3), and ~~On the other hand the~~ ^{rotating 2nd} transmitting member 30 ^{with} reduced speed ⁱⁿ rotation at fifth speed forward or first speed reverse, and ~~there may be cases~~ ^{when} ~~wherein~~ the transmitting member is fixed at sixth speed

(the rotational speeds of)

forward, ~~and the rotation~~ difference between the hub unit 22 and the transmitting member 30 may become large. However, because this clutch C1 is located on the opposite side of ~~the planetary gear PR via the planetary gear unit PU, the~~ hub unit 22 and the transmitting member 30 can be ~~configured~~ ^{spaced} apart, and, compared with the case wherein for example those units are configured in ~~contact with~~ a multi-axial construction, the decreased ⁱⁿ efficiency of the automatic transmission, ~~resulting~~ ^{which would otherwise result} from the relative rotation occurring because of friction between those units, can be prevented.

Further, since the counter gear 5 is ~~configured in the~~ ^{intermediate second} axial ^{unit} direction between the planetary gear unit PU and the ^{first} planetary gear PR, the counter gear 5 can be ~~configured in~~ ^{axial} approximately the ^{center} ~~in the axial direction~~ of the automatic transmission. For example, when the automatic transmission is mounted on the vehicle, ^{enlargement in} ~~enlarging towards~~ ^{axial} one ~~direction of the axis~~ (particularly in the rear ^{where} direction when the input ~~side~~ from the drive source is ^{at} the ~~axial~~ front direction) can be ^{avoided} ~~prevented~~ because the counter gear 5 is mounted ^{adjacent} ~~to match~~ the drive wheel transmission mechanism. Because of this, particularly in the case of an FF vehicle, the interference ^{with} ~~toward~~ the front wheels is reduced, ~~and the~~ mountability on a vehicle ^{is} ~~can be~~ improved, ^{and} ~~such~~ the steering angle ^{is} ~~being~~ greatly improved, ~~for example~~.

Further, in the event that the ^{hydraulic} ~~oil pressure~~ servo 13 ^{adjoins} ~~is~~

~~configured~~ ^{first} ~~adjoined~~ to the planetary gear ^{unit} PR for example,
and the hub unit 26 ^{serves as} ~~is made to be~~ the cylinder ~~unit~~ for the
^{hydraulic} oil pressure servo 13, ^{it becomes necessary} ~~the necessity arises~~ to provide one
set of seal rings between the hub ~~unit~~ 26 and the input
shaft 2. However, the ^{hydraulic} oil pressure servo 13 of the clutch
C3 is ^{located} ~~configured~~ on the ^{axially opposite} ~~opposite~~ side of the friction plates
73 ^{and,} ~~from~~ the planetary gear PR ~~in the axial direction,~~
therefore, seal rings are not provided, ^{and thus} ~~in other words,~~ the
number of seal rings ^{is} ~~can be~~ reduced, sliding resistance ^{is} ~~can~~
~~be~~ reduced, and by doing so ^{is} the efficiency of the automatic
transmission ~~can be~~ improved.

^{Because} ~~Further,~~ the automatic transmission ~~device~~ 1, according
to the ^{first} ~~present~~ embodiment ~~is a transmission device that is~~
directly coupled ⁱⁿ ~~at~~ fourth speed forward. ~~Therefore, at in~~
fifth speed forward and ⁱⁿ ~~sixth~~ speed forward, the gear ratio
can be ~~specified at~~ a high ratio, and particularly when
~~mounted on a vehicle, in the event that the vehicle is~~
running at a high speed, the engine ^{speed} ~~revolutions~~ can be
^{reduced} ~~lowered,~~ and this contributes to ~~the quietness of~~ the
vehicle while running at a high speed.

~~In order to solve the above described problems,~~
~~proposals have been made such as those in Japanese~~
Unexamined Patent Application Publication No. 8-68456, ^{proposes}
~~However, the article in this Publication has a construction~~
wherein a clutch is ^{located in} ~~configured on the line that transmits~~ ^{path of}

~~the reduced rotation of the reducing planetary gear to the input~~
~~rotation component of the planetary gear unit, and because~~
~~the line that transmits this reduced rotation is a line~~
~~wherein a large torque is input, the clutch or members that~~
transmit the torque must be constructed so as to withstand
this large torque. In other words, the number of friction
members ^{as} on a clutch must be increased, or the size thereof
increased, or the ^{hydraulic} oil pressure servo for ^{operating} pressurizing the
^{clutch} friction member must be made larger. Further, because a
brake must be ^{designed} configured to ^{hold} retain the ^{rotary element} rotation component of
the planetary gear unit, this automatic transmission ^{against rotation} ~~was~~ ^{proposed} ~~could not be made~~
~~insufficient with regard to being compact in size.~~

Therefore, it is an object of the present embodiment to
provide an automatic transmission that solves the above-
mentioned problems, by constructing a compact clutch and
brake in the area of the reducing planetary gear ^{unit}.

Therefore, ⁱⁿ ~~according to~~ the automatic transmission
~~device 1, relating to~~ ^{of} the present embodiment, the clutch C3
is located between the input shaft 2 and the sun gear S1,
and therefore, compared to the case wherein the clutch C3 is
located for example between the ring gear R1 and the sun
gear S3, the ^{load} ~~burden~~ on the clutch C3 ^{is} ~~can be~~ decreased, and
the clutch C3 can be made more compact. Further, because
the friction member ^s and ^{hydraulic} oil pressure servo of the clutch C3
can be made smaller, these ^{members} ~~can be~~ ^{located} configured on the inner
^{radially}

~~circumference side in the radial direction~~ of the brake B1,
and the automatic transmission can be made more compact.

N Second Embodiment

A The second embodiment, which is a partial modification
of the first embodiment, will be described *?* with reference to
Fig. 4. Fig. 4 is a schematic cross-sectional diagram
of illustrating the automatic transmission ~~device of an~~
~~automatic transmission relating to~~ *of* the second embodiment.

Now Components of the second embodiment which are the same
as those of the first embodiment ~~will be~~ *are* denoted ~~with the~~ *by*
same reference numerals, *in Fig. 4* and description thereof omitted,
those components except for *ed* partial modifications.

As Fig. 4 illustrates, the automatic transmission
~~device 12 of the automatic transmission relating to the~~
second embodiment has the input ~~side~~ *ends* and output ~~side~~
The reverse backwards from that of the automatic transmission ~~device 11~~
of the automatic transmission of the first embodiment (see
Fig. 1). *However operations establishing* Further, the ~~actions of~~ the first speed forward
through the sixth speed forward and the first speed reverse
are is similar (see Fig. 2 and Fig. 3).

As shown in Fig. 4, in
~~As described above, according to~~ the automatic
transmission device 12 *of* relating to the *second embodiment*
first the planetary gear *unit* ~~PU~~ and the clutch C3 are ~~configured on~~ *located at*
one ~~side in the axial direction~~ *end* of the planetary gear unit
PU, and the clutch C1 and the clutch C2 are ~~configured on~~ *located at*

the other ~~side in the~~ ^{end} axial direction of the planetary gear unit PU, and therefore ^{the transmission is} directly coupled ⁱⁿ when at fourth speed forward, and can ^{provide} achieve six forward speeds and one reverse speed. The planetary gear ^{unit} PR and the planetary gear unit PU can be ^{located} ~~configured~~ closer together, ^{as} compared to the case wherein for example the clutch C1 and the clutch C2 are ^{located} ~~configured~~ between the planetary gear PR and the planetary gear unit PU, and the transmitting member 30 for transmitting the reduced rotation can be made relatively short. ^{or} Therefore, the automatic transmission can be made ^{more} compact and lightweight, and further, because the inertia ^{inertial} (force of inertia) can be reduced, the controllability of the automatic transmission can be improved, and the occurrence of speed change shock can be reduced.

Further, ^{because} the clutch C3 is ^{located at} ~~configured on one side in the~~ ^{axial} ~~axial direction~~ of the planetary gear unit PU, and the clutch C1 and the clutch C2 are ^{located at} ~~configured on the other~~ ^{axial} ~~in the axial direction~~ of the ^{second} planetary gear unit PU, ^{as} ~~therefore~~ compared to the case wherein the three clutches C1, C2, and C3 are ^{located} ~~configured~~ on one side of the ^{second} planetary gear unit PU for example, the construction of ~~an~~ oil line ^{which} (for example, 2a, 2b, 92, 93, 94) ^{hydraulic} to provide oil to the ~~oil~~ ~~pressure~~ servos 11, 12, and 13 for these clutches C1, C2, C3 can be made easily, ~~and~~ the manufacturing process can be simplified and the costs brought down.

^{more}

Further, because the oil pressure servos 11 and 13 are provided on the input shaft 2, one set of seal rings 81 and 82 ^{form a) with} seal the case 3 and supply oil to the oil lines 2a, and 2b provided within input shaft 2, and therefore oil can be supplied to the oil compartment ^s of ~~oil pressure~~ ^{hydraulic} servos 11 and 13 without providing seal rings between, for example, the input shaft 2 and the ~~oil pressure~~ ^{hydraulic} servos 11 and 13. Further, the ~~oil pressure~~ ^{hydraulic} servo 12 can ^{receive of directly} supply oil from the boss unit 3b ~~provided from the case 3~~, without passing through other units, ~~for example, in other words, can supply~~ ^{utilizing only} oil by providing one set of seal rings 83. Therefore, oil can be supplied simply by providing one set of seal rings 81 and 82, 83 each for the oil pressure servos 11, 12, and 13, and sliding resistance from the seal rings can be minimized, and therefore the efficiency of the automatic transmission can be improved.

^{Because} ~~Further~~, the clutch C1 ~~is a clutch that~~ engages at relatively slow to medium speed ^{s, i.e.} ~~levels of~~ first speed forward, second speed forward, third speed forward, and fourth speed forward, and ~~therefore then this clutch C1 is~~ released at fifth speed forward, sixth speed forward, ^{and} ~~or~~ first speed reverse, which are relatively high speed ^s ~~levels~~, the hub unit 22 that connects ~~in particular~~ this clutch C1 ^{will} and sun gear S2 rotates at a relatively high ^{speed} ~~rotation~~ or in reverse ~~rotation~~ ^{because} (see Fig. 3), and ~~while~~ the transmitting

member 30 reduces speed^{the of} rotationⁱⁿ at fifth speed forward^{and} or first speed reverse, and there may be cases wherein the transmitting member is fixed^{because} at sixth speed forward, ~~and~~ the ⁱⁿ ~~rotation~~ difference between the hub unit 22 and the transmitting member 30 may become large. However, because ~~this~~ clutch C1 is located on the opposite side of the planetary gear^{unit} PR ~~via the~~ planetary gear unit PU, the hub ^{second} ~~unit~~ 22 and the transmitting member 30 can be ^{opposite} ~~configured~~ ^{spaced} apart, and compared with the case wherein for example those units are ~~configured~~ in contact ⁱⁿ with a multi-axial ~~construction~~ ^{design}, the decreasedⁱⁿ efficiency of the automatic transmission resulting from the relative rotation occurring because of friction between ~~these~~ units can be prevented.

Further, because the counter gear 5 is ^{located} ~~configured in~~ the axial direction between the planetary gear unit PU and the planetary gear^{unit} PR, the counter gear 5 can be ^{located} ~~configured~~ in approximately the ^{axial} ~~center in the axial direction~~ of the automatic transmission. For example, when the automatic transmission is mounted on the vehicle, enlarging ^{ment in} ~~towards~~ one^{axial} direction ~~of the axis~~ (particularly in the rear direction when the input side^{which connects with} ~~from~~ the drive source is the "front" direction) ^{is not necessary} ~~can be prevented~~ because the counter gear 5 is mounted ^{adjacent} ~~to match~~ the drive wheel transmission mechanism.

Because of this, particularly in the case of an FF vehicle, ~~the~~ interference ^{with} ~~toward~~ the front wheels is reduced, and the

mountability on a vehicle ^{is} ~~can be~~ improved, such ^{that} the steering angle ^{is} ~~being~~ greatly improved, for example,

Further, in the event that the ~~oil pressure~~ ^{hydraulic} servo 13 is ~~located~~ ^{located} ~~configured~~ ⁱⁿ ~~adjoined to~~ ^{first} the planetary gear ^{unit} ~~PR~~, for example, and the hub ~~unit~~ ^{serves as} 26 is made to be the cylinder ~~unit~~ ^{of} for the ~~oil pressure~~ ^{hydraulic} servo 13, ~~the necessity arises~~ ^{it becomes necessary} to provide one

set of seal rings between the hub ~~unit~~ 26 and the input shaft 2. However, ^{in this second embodiment} ~~the oil pressure~~ ^{hydraulic} servo 13 of the clutch C3 is ~~configured~~ ^{located} on the ~~opposite~~ ^{axially opposite} side of the friction plates 73 ~~from the planetary gear PR in the axial direction, and~~ ^{first} therefore seal rings are ~~not provided~~ ^{omitted}, in other words, the ~~total~~ ^{total} number of seal rings ~~can be~~ ^{is} reduced, sliding resistance ~~can~~ ^{is} be reduced, and ~~by doing so,~~ ^{thus} the efficiency of the automatic transmission ~~can be~~ ^{is} improved.

Further, the automatic transmission ~~device~~ ^{is} 12 ~~according to the present embodiment is a transmission device that is~~ directly coupled ⁱⁿ ~~at~~ fourth speed forward. Therefore, ~~at~~ ⁱⁿ fifth speed forward and sixth speed forward, the gear ratio can be ~~specified at~~ a high ratio, and particularly when ~~mounted on a vehicle, in the event that the vehicle is~~ running at a high speed, the engine ~~revolutions~~ ^{speed} can be lowered, ~~and this contributes to the quietness of the~~ ^{allowing} vehicle ~~while running~~ ^{to} ~~at~~ ^{more quietly} a high speed.

~~In order to solve the above-described problems,~~
~~proposals have been made such as those in Japanese~~

Unexamined Patent Application Publication No. 8-68456 *proposes*

~~However, the product in this Publication has a construction~~

~~wherein a clutch is *located in* configured on the line that transmits the reduced *speed* rotation of the reducing planetary gear *unit* to the *input* *rotary element* of the planetary gear unit, and because the line that transmits this reduced *speed* rotation *bears* is a line~~

~~wherein a large torque *is input*, the clutch or members that transmit the torque must be constructed so as to withstand this large torque. In other words, the number of friction~~

~~members *of* a clutch must be increased, or the size thereof increased, or the *hydraulic* oil pressure servo for *engaging* pressurizing the friction member *able* must be made larger. Further, because a~~

~~brake must be *brake* configured to retain the rotation component of the planetary gear unit, this automatic transmission *ry element* was~~

~~insufficient *could not be made* with regard to being compact in size.~~

~~Therefore, by constructing a compact clutch and brake in the area of the reducing planetary gear, *unit* it is an object of the~~

~~this *second* present embodiment *to* provide an automatic transmission that solves the above-mentioned problems.~~

~~Therefore, *In* according to the automatic transmission~~

~~1, *of this second* device *because* relating to the present embodiment, the clutch C3~~

~~is located between the input shaft 2 and the sun gear S1,~~

~~and therefore, compared to the case wherein the clutch C3 is~~

~~located for example between the ring gear R1 and the sun~~

~~gear S3, the *load* burden on the clutch C3 can be decreased, and~~

the clutch C3 can be made more compact. Further, because the friction member ^{hydraulic} and ~~oil pressure~~ servo of the clutch C3 can be made smaller, they can be ^{located} ~~configured~~ ^{radially} on the inner ~~circumference~~ side ~~in the radial direction~~ of the brake B1, and the automatic transmission can be made more compact.

~~Third Embodiment~~

The third embodiment, which is a partial modification of the first embodiment will be described ² with reference to Fig. 5 through Fig. 7. ~~Fig. 5 is a schematic cross-sectional diagram illustrating the automatic transmission device of an automatic transmission relating to the third embodiment, Fig. 6 is a operational table of an automatic transmission relating to the third embodiment, and Fig. 7 is a speed line diagram of an automatic transmission relating to the third embodiment.~~ Now, Components of the third embodiment which are the same as those of the first ^{in Figs. 5-7} embodiment ^{are} ~~will be~~ ^{by} denoted with the same reference numerals, and description thereof omitted, except for ^{those components} ~~partially~~ ^{ed} modifications.

As Fig. 5 illustrates, the automatic transmission ~~device 13 of the automatic transmission relating to the~~ ^{differs from the first embodiment in} third embodiment ^{unit} ~~changes~~ the configuration of the planetary gear PR, and further, ^{in that} ~~configured~~ a brake B3 (the first brake) ^{replaces} ~~in place of~~ the clutch C3, and ^{is modified} ~~changed~~ the carrier CR1 of the planetary gear PR ^{so as to be capable of being} ^{first} ^{unit}

fixed by the brake B3, ~~as compared to that of the automatic transmission device 11 of the automatic transmission of the first embodiment (see Fig. 1).~~

In this third embodiment the located

The brake B3 is configured on the opposite side of the *opposite the second* planetary gear unit PU (right side of diagram) of the *first* planetary gear ^{unit} PR within this automatic transmission device

13. This brake B3 comprises *a hydraulic* an oil pressure servo 16, a friction plate 76, and a hub ~~unit~~ 33. Further, the brake B1 *located radially outward* is configured on the ~~outer circumference side~~ of the brake B3.

The hub ~~unit~~ 33 of ~~this~~ brake B3 is connected to one side plate of the carrier CR1, and ~~this~~ carrier CR1 is *rotatably* supported by the input shaft 2 or the boss ~~unit~~ 3a, *so as to*

~~be capable of rotating.~~ Further, the sun gear S1 is

connected to the input shaft 2. Also, the friction plate 74 of the brake B1 *are* ~~is~~ splined to the outer circumference *trial surface* side

of the ring gear R1, and also this ring gear R1 is connected *the sun gear S3 via* to the transmitting member 30, ~~and the sun gear S3 is~~

~~connected via this transmitting member 30.~~ In other words,

the ring gear R1 and the sun gear S1 are constantly *in connected*

~~contact~~ with one another, with no clutch located *there* ~~between them~~

for constant transmission of ~~example, and the rotation, can constantly be transmitted.~~

~~Continuing, based on the above-mentioned construction,~~

The operations of the automatic transmission device 13 will now
with reference to
be described ~~following~~ Fig. 5, Fig. 6, and Fig. 7 below.

~~Now,~~ Similar to the above-mentioned first embodiment, the vertical axis^e of the speed line diagram illustrated in Fig. 7 indicate the ~~revolutions~~^{speed of rotation} of each ~~rotation component~~^{rotary element}, and the horizontal axis indicates the corresponding gear ratio of these ~~rotation components~~^{rotary elements}. Further, ~~regarding the~~^{In} ~~second~~ planetary gear unit PU section of this speed line diagram, the vertical axis ~~to the farthest horizontal edge~~^{at} ~~the right side of Fig. 7~~² corresponds to sun gear S3, and ~~hereafter~~ moving to the left ~~direction~~ within the diagram, the vertical axis^e corresponds to the carrier CR2, the ring gear R3, and the sun gear S2. Further, ~~regarding the~~^{In} ~~planetary~~^{first} gear^{unit} PR section of this speed line diagram, the vertical axis ~~to the farthest horizontal edge~~^{at} ~~the right side of Fig. 7~~³ corresponds to sun gear S1, and ~~hereafter~~ moving to the left ~~direction~~ within the diagram, the vertical axis^e corresponds to the ring gear R1 and the carrier CR1. Further, the width^s between these vertical axes are ~~inversely~~^{inversely} proportional to the ~~inverse of the~~ number of teeth of each of the sun gears S1, S2, S3, and to the ~~inverse of the~~ number of teeth of each of the ring gears R1, R3. Also, the dotted line in a horizontal direction within the diagram ~~represents~~^{represents} ~~illustrates that the rotation is~~ transmitted from the transmitting member 30.

As illustrated in Fig. 5, the ~~above-mentioned~~ carrier CR1 is fixed to the case 3 by ~~the brake B3 retaining~~^{engagement of}.

Further, the rotation of the input shaft 2 is input to the sun gear S1, ^{and} the ~~above-mentioned~~ ring gear R1 ^{rotates} ~~decreases~~ ^{at a} ~~rotation speed based on the rotation~~ ^{reduced from that} of the input shaft 2 ^{which} ~~that~~ is input to ~~this~~ sun gear S1, ^{with} ~~by this~~ carrier CR1 being fixed. ^{Thus} ~~In other words~~, the reduced ^{speed} rotation of the ring gear R1 is input to the sun gear S3 via the transmitting member 30, by engaging ^{ement of} the brake B3.

ⁱⁿ ~~By doing so~~, ^{first} ~~As~~ Fig. 6 and Fig. 7 illustrate, ^{unit in} ~~regarding~~ the planetary gear PR, ~~at~~ third speed forward, fifth speed forward, and first speed reverse, the rotation of the input shaft 2 is input to the sun gear S1 by ^{engaging} ~~retaining~~ the brake B3, ^{to fix} ~~the~~ carrier CR1 ~~is fixed~~, and the reduced ^{speed} rotation is output to the ring gear R3 by the rotation of the sun gear S1 ^{which is input from} ~~wherein the rotation of the input shaft 2 is input~~, and the reduced ^{speed} rotation is input to the sun gear S3 via the transmitting member 30. ^{Because} ~~In this case~~, the ring gear R1 and the sun gear S3 are rotating at ^{2,} reduced speed, ~~therefore the~~ ^{transmits} ~~above-mentioned~~ transmitting member 30 ~~performs~~ a relatively large torque ~~transmission~~. On the other hand, ⁱⁿ ~~at~~ first speed forward, second speed forward, fourth speed forward, and sixth speed forward, the rotation of the sun gear S3 is input to the ring gear R1 via the transmitting member 30, and further, because the brake B3 is released, as Fig. 7 illustrates, the carrier CR1 rotates ^{at a speed} ~~based on each~~ the ^{rotational} ~~rotation within the speed level of this~~ ring gear R1 and the

rotational speed of

described above

sun gear S1 ^{input from} of the rotation of the input shaft 2.

Operations

Now, the actions other than those of the ~~above~~ mentioned ^{first} planetary gear ^{unit} PR, are similar to those of the ~~above described~~ first embodiment (see Fig. 2 and Fig. 3), and, accordingly, description thereof will be omitted.

As described above, ⁱⁿ ~~according to~~ the automatic transmission ~~device 1,~~ ^{of this third embodiment} relating to the present invention, the planetary gear PR and the brake B3 are ^{located} ~~configured~~ on one ^{axial} side ~~in the axial direction~~ of the ^{second} planetary gear unit PU, and the clutch C1 and the clutch C2 are ^{located} ~~configured~~ on the ^{axial} other ^{second} side ~~in the axial direction~~ of the ^{second} planetary gear unit PU. Therefore, ^{the} ~~an~~ automatic transmission can ~~be~~ provided ~~that will achieve~~ six forward speeds and one reverse speed, with direct coupling ⁱⁿ ~~at~~ fourth speed forward. For example, compared to the case wherein ^{the} ~~a~~ clutch C1 or clutch C2 is ^{located} ~~configured~~ between the planetary gear ^{first} PR and the ^{unit} planetary gear unit PU, the ^{first} planetary gear PR and the ^{second} planetary gear unit PU can be ^{located} ~~configured~~ close together, and the transmitting member 30 for transmitting the reduced rotation can be made relatively short. Therefore, the automatic transmission can be made ^{more} ~~compact~~ and lightweight, and further, because the inertia ^{inertia} ~~(force of inertia)~~ can be reduced, the controllability of the automatic transmission can be improved, and the occurrence of speed change shock can be reduced.

Further, because the ~~oil pressure~~ ^{hydraulic} servo 11 is provided on the input shaft 2, one set of seal rings 82 ^{forms} ~~seal~~ ^{with} the case ^{provide a connection for} 3 and ^{of} supply ^{from} oil to the oil lines 2b provided within input shaft 2, ~~and therefore oil can be supplied~~ to the oil compartment of ~~oil pressure~~ ^{hydraulic} servo 11 without ^{2nd} ~~providing~~ seal rings between, for example, the input shaft 2 and the ~~oil~~ ^{hydraulic} pressure servo 11. Further, ~~oil pressure~~ ^{hydraulic} servo 12 can ^{of} ~~receive~~ ^{directly} supply oil from the boss unit 3b ~~provided from the case~~ ^{formed}, without passing through other units for example. In other words, ~~you~~ ^{of} supply ^{is} oil ^{by a connection with} by providing one set of seal rings 83. Therefore, oil can be supplied simply by providing one set of seal rings 82, 83 ^{for} ^{of} ~~each for the oil pressure~~ ^{hydraulic} servos 11, 12, and sliding resistance from the seal rings can be minimized, and therefore the efficiency of the automatic transmission can be improved.

Further, ^{because} the clutch C1 ~~is a clutch that~~ engages at relatively slow to medium speed levels ⁵ ^{i.e.} of first speed forward, second speed forward, third speed forward, and fourth speed forward, and ~~therefore then this clutch C1 is~~ released ⁱⁿ at fifth speed forward, sixth speed forward, ~~and~~ ^{and} first speed reverse, which are relatively high speed levels, the hub unit 22 that connects ~~in particular~~ this clutch C1 and sun gear S2 rotates at a relatively high ~~rotation~~ ^{speed} or in reverse ~~rotation~~ (see Fig. 7). ^{Because} ~~and on the other hand the~~ transmitting member 30 ^{rotates at a} ⁱⁿ reduces speed ~~rotation~~ at fifth speed

forward ^{and in} or first speed reverse, ^{because} and there may be cases wherein the transmitting member is fixed ⁱⁿ at sixth speed forward, ^{speed 05} and the rotation difference ⁱⁿ between the hub ~~unit~~ 22 and the transmitting member 30 may become large. However, ^{the present invention locates} because this clutch C1 is located on the opposite side of ^{first unit} the planetary gear ^{second} PR ^{opposite} ~~the~~ planetary gear unit PU ~~the~~ the hub ~~unit~~ 22 and the transmitting member 30 can be ~~configured~~ ^{spaced further} apart, ^{as} and compared with the case wherein for example those units are ~~configured~~ in contact with a multi-axial construction, ^{and} the decreased ⁱⁿ efficiency of the automatic transmission resulting from the relative rotation occurring because of friction between those units can be prevented.

Further, due to the counter gear 5 being ^{located} ~~configured~~ in the axially ^{intermediate} ~~direction~~ between the ^{second} planetary gear unit PU and the ^{first} planetary gear ^{unit} PR, the counter gear 5 can be ^{located at} ~~configured~~ ^{axial} in approximately the ^{center} ~~in the axial direction~~ of the automatic transmission. For example, when the automatic transmission is mounted on ^a the vehicle, enlarging ^{ment in} towards one ^{axial} ~~direction of the axis~~ (particularly in the rear direction when the ~~input~~ ^{which receives input} side from the drive source is the front ^{becomes unnecessary} direction) can be prevented because the counter gear 5 is mounted to ^{adjoin} ~~match~~ the drive wheel transmission mechanism. Because of this, particularly in the case of a FF vehicle, ^{with} the interference ~~toward~~ the front wheels is reduced, and the mountability on a vehicle can be improved, ^{and} ~~such~~ the steering

angle ^{can be} being greatly improved, ~~for example.~~

Further, because the reduced ^{speed} rotation output to the ^{second} planetary gear unit PU from the ^{first} planetary gear PR is ^{controlled by} engaged and disengaged ^{ment} by the brake B3, the number of parts (for example drum ^{ment of} shaped members and so forth) can be reduced compared to the case wherein, for example, a clutch C3 is provided. Further, the brake B3 can ^{be operated by} ^{received} ~~configure an oil line~~ ^{a line in} directly from the case 3, and therefore the construction of an oil line can be simplified as compared to the case wherein, for example, a clutch C3 is provided.

Further, the automatic transmission ~~device~~ 1, according to ^{this third} ~~the present~~ embodiment is ~~a transmission device that is~~ directly coupled ⁱⁿ at fourth speed forward. Therefore, at ^{1st} fifth speed forward and sixth speed forward, the gear ratio can be ~~specified at~~ a high ratio, and particularly ^{for high} when ~~mounted on a vehicle, in the event that the vehicle is~~ ~~running at a high speed,~~ ^{speed} the engine ~~revolutions~~ can be lowered, ^{makes} and this ~~contributes to the quietness of the~~ ^{more quiet} vehicle while running at a high speed.

In order to solve the above-described problems, ~~proposals have been made such as those in Japanese~~ Unexamined Patent Application Publication No. 8-68456, ^{propose} ~~However, the product in this Publication has a construction~~ wherein a clutch is ^{located} ~~configured on the line that transmits~~ the reduced ^{speed} rotation of the reducing planetary gear ^{set} to the

~~input rotary element~~ ~~second~~
rotation component of the planetary gear unit, and because
the line that transmits this reduced ^{speed} rotation ~~is a line~~ ^{with}
~~wherein a large torque is input, this clutch or members that must~~ ^{other}
transmit the ^{high} torque must be constructed so as to withstand
~~this large torque.~~ ^{high} In other words, the number of friction
members ^{of} a clutch must be increased, ~~the~~ the size thereof
increased, or the ^{hydraulic} oil pressure servo for ^{engaging} pressurizing the
~~friction member must be made larger.~~ ^{clutch} Further, since a brake
must be ^{provided stop rotation of rotary element} configured to retain the ~~rotation component~~ of the
~~second~~ planetary gear unit, this automatic transmission ~~was~~ ^{could not be made}
~~insufficient with regard to being compact, in size.~~
~~Therefore, by constructing a compact clutch and brake in the~~ ^{providing}
area of the reducing planetary gear, ~~it is an object of the~~ ^{unit}
~~this present embodiment to provide an automatic transmission that~~ ^{also}
~~solves the above mentioned problems.~~ ^{is more compact overall.}
~~Therefore, according to the automatic transmission~~ ^{In}
~~device 1, relating to the present embodiment, the carrier~~ ^{of}
CR1 is fixed by the brake B3, and therefore, compared to the
case wherein the clutch is located between the ring gear R1
and the sun gear S3 for example, the load on the brake B3
can be reduced, and the friction member ^s of the brake B3 and
~~its hydraulic~~ the oil pressure servo can be made smaller. Therefore,
~~these can be configured on the inner circumference side in~~ ^{elements located radially}
~~the radial direction of the brake B1, and the automatic~~ ^{inward}
transmission can be made more compact.

Fourth Embodiment

The fourth embodiment, which is a partial modification of the first embodiment will be described with reference to Fig. 8 through Fig. 10. ~~Fig. 8 is a schematic cross~~

~~sectional diagram illustrating the automatic transmission device of an automatic transmission relating to the fourth embodiment, Fig. 9 is a operational table of an automatic transmission relating to the fourth embodiment, and Fig. 10 is a speed line diagram of an automatic transmission relating to the fourth embodiment.~~

~~Now,~~ components of the fourth embodiment which are the same as those of the first embodiment ^{are} will be ^{by} denoted with the same reference numerals, and description thereof ^{will be} omitted, except for ^{the} partial modifications.

As Fig. 8 illustrates, the automatic transmission device 1₄ of the ~~automatic transmission relating to the~~ fourth embodiment ^{differs in} changes the configuration of the planetary gear ²⁵ PR compared to that of the automatic transmission device 1₁ of the ~~automatic transmission~~ of the first embodiment (see Fig. 1), and further, a brake B3 is ^{added} configured, and rotation of the input shaft 2 is ^{first} capable of ^{unit} being input to the sun gear S1 of the planetary gear ^{against rotation} PR by the clutch C3 and the carrier CR1 can be fixed by the brake B3.

The clutch C3 is ^{located} configured on the planetary gear unit

PU side (left side of diagram) of the ^{first} planetary gear ^{unit} PR
~~within this automatic transmission device 1, and the brake~~
~~B3 is configured on the planetary gear PR on the opposite~~
~~side (right side of diagram) from the planetary gear unit PU.~~ ^{located side of the first unit} ^{second} ^(right side of diagram)
The inner circumference ^{pal surfaces} ^{forward portion} of the front edge of the drum
~~shaped member 25 of this clutch C3 is splined to the~~
friction plate 73, and the ~~inner circumference side of this~~
friction plate 73 ^{are intermeshed with friction plates} is splined to the hub ~~unit~~ 26. ~~Further,~~
~~the drum shaped member 25 is connected to the input shaft 2,~~
and the hub ~~unit~~ 26 is connected to the sun gear S1.
~~The brake B3 is configured on the opposite side of the~~
~~planetary gear unit PU (right side of diagram) of the~~
~~planetary gear PR. This Brake B3 comprises an oil pressure~~ ^{includes a hydraulic}
servo 16, ~~friction plate 76, and a hub unit 33.~~ ^{are} ^{to} ^{oil surface}
friction plate 76 ^{is} splined on the outer circumference ~~side~~
of the hub ~~unit 33 of this brake B3, and~~ the hub ~~unit~~ 33 is
connected to one side plate of the carrier CR1, and ~~this~~
carrier CR1 ^{rotatably} is supported by the input shaft 2 or the boss
~~unit 3a, so as to freely rotate.~~ Also, the friction plate 74
of the brake B1 ^{are} ^{to} is splined on the outer circumference ~~side~~
of the ring gear R1, and this ring gear R1 is connected to
~~the transmitting member 30, and the sun gear S3 is connected~~
via ~~this~~ transmitting member 30. In other words, the ring
gear R1 and the sun gear S3 are constantly ^{connected} in contact with
one another, with no clutch located ^{there} between, and the

rotation ^{is} ~~can~~ constantly ~~be~~ transmitted.

~~Continuing, based on the above mentioned construction,~~

(47) The operations of the automatic transmission device 1₄ will ^{now} be described ^{with reference to} ~~following~~ Fig. 8, Fig. 9, and Fig. 10 below.

~~Now,~~ ^e Similar to the ~~above mentioned~~ first embodiment, the vertical axis of the speed line diagram illustrated in Fig. 10 indicate the ^{speed} ~~revolutions~~ of each ^{rotary element} ~~rotation component~~, and the horizontal axis indicates the corresponding gear ratios of these ^{rotary elements} ~~rotation components~~. Further, ^{In} ~~regarding~~ the ^{second} ~~planetary gear unit~~ PU section of this speed line diagram, the vertical axis ~~to the farthest horizontal edge (the right side of Fig. 10)~~ ⁴ corresponds to sun gear S3₂ and, ~~hereafter~~ moving to the left ~~direction~~ within the diagram, the vertical axis ^e ~~corresponds~~ ^{, in succession,} to the carrier CR2, the ring gear R3, and the sun gear S2. ^{In first} ~~Further, regarding~~ the planetary gear ^{unit} PR section of this speed line diagram, the vertical axis to the farthest ~~horizontal edge (the right side of Fig. 10)~~ ¹ corresponds to sun gear S1₂ and, ~~hereafter~~ moving to the left ~~direction~~ within the diagram, the vertical axis ^e ~~corresponds~~ ^{consecutively} to the ring gear R1 and the carrier CR1. Further, the width ³ between these vertical axes are ^{inversely} proportional to the ~~inverse of the~~ number of teeth of each of the sun gears S1, S2, S3, and to the ~~inverse of the~~ number of teeth of each of the ring gears R1, R3. Also, the dotted line ^{extending} ~~in a horizontal direction~~ within the diagram

~~represent~~^{represent} ~~illustrate that the~~ rotation ~~is~~^{by} transmitted ~~from~~ the transmitting member 30.

As Fig. 8 illustrates, the rotation of input shaft 2 is input to the ~~above mentioned~~ sun gear S1 by engaging the clutch C3. Further, the ~~rotation of the above mentioned~~ carrier CR1 is fixed to the case 3 ~~by~~^{engagement of} the brake B3,

~~retaining~~^{are engaged} Therefore, when the clutch C3 ~~engages~~^{rotates at 2} and the brake B3 ~~retains~~^{decreased}, the above-mentioned ring gear R1 ~~decreased~~^{reduced from that of} rotation speed ~~based on~~ the rotation of input shaft 2 which is input to this sun gear S1. In other words, by engaging the clutch C3 and ~~retaining with~~ the brake B3, the reduced ~~speed~~^{speed} rotation of the ring gear R1 is input to the sun gear S3 via the transmitting member 30.

~~By doing so,~~ⁱⁿ ~~As~~^{unit} Fig. 9 and Fig. 10 illustrate, regarding the planetary gear ^{PR}, at third speed forward, fifth speed forward, and first speed reverse, the rotation of the input shaft 2 is input to the sun gear S1 by engaging the clutch C3, and further, the carrier CR1 is fixed by ~~engagement of~~^{speed} the brake B3, and therefore the reduced ~~rotation~~^{due to fixation of the} is output to the ring gear R3 ~~by the fixed carrier CR1~~, and the reduced ~~rotation~~^{speed} is input to the sun gear S3 via the transmitting member 30. In this case, the ring gear R1 and the sun gear S3 are rotating at ~~reduced speed~~^{the and,}, therefore, the ~~above mentioned~~^{transmits} transmitting member 30 ~~performs~~ⁱⁿ a relatively large torque ~~transmission~~. On the other hand, ~~at~~^{at} first

speed forward, second speed forward, fourth speed forward, and sixth speed forward, the rotation of the sun gear S3 is input to the ring gear R1 via the transmitting member 30, but because the clutch C3 and the brake B3 are released, the carrier CR1 and the sun gear S1 rotate.

Now, ^{operations of the} ~~the actions, other than those of the above~~ ^{mentioned} ~~mentioned~~ ^{S, R1} ~~planetary gear~~ ^{unit} ~~PR~~ are similar to those of the ~~above-described~~ first embodiment (see Fig. 2 and Fig. 3), and, accordingly, description thereof will be omitted.

As described above, ⁱⁿ ~~according to~~ the automatic transmission device 1, ^{of this fourth embodiment} ~~relating to the present invention,~~ ^{first} ~~the~~ ^{unit} ~~planetary gear~~ ^{PR}, the clutch C3, and the brake B3 are ^{located} ~~configured on one~~ ^{axial} ~~side in the axial direction of the~~ ^{second} ~~second~~

^{located} ~~planetary gear unit PU, and the clutch C1 and the clutch C2 are configured on the other side in the axial direction of the~~ ^{second} ~~planetary gear unit PU, thereby providing~~ ^{having} ~~transmission can be provided that will achieve six forward speeds and one reverse speed with direct coupling at fourth~~ ⁱⁿ ~~speed forward.~~

For example, compared to the case wherein a

^{located} ~~clutch C1 or clutch C2 is configured between the~~ ^{first} ~~planetary gear~~ ^{unit} ~~PR and the~~ ^{second} ~~planetary gear unit PU, the~~ ^{first} ~~planetary gear unit~~ ^{second} ~~PR and the~~ ^{located} ~~planetary gear unit PU can be configured closer~~ ^{which} ~~together, and the transmitting member 30 for transmitting~~ ^{speed} ~~the reduced~~ ^{er} ~~rotation can be made relatively short.~~ ^{more} ~~Therefore, the automatic transmission can be made~~ ^{compact}

and lightweight, and further, because the inertia (^{inertial}force of inertia) can be reduced, the controllability of the automatic transmission can be improved, and the occurrence of speed change shock can be reduced.

Further, ^{because} the clutch C3 is ^{located} ^{axial} ~~configured~~ on one side ~~in the~~ ^{second} ~~axial direction~~ of the planetary gear unit PU, and the clutch C1 and the clutch C2 are ^{located} ^{axial} ~~configured~~ on the other ^{second} ~~side~~ ~~in the axial direction~~ of the planetary gear unit PU, ~~therefore~~ compared to the case wherein the three clutches C1, C2, and C3 are ^{located} ^{second} ~~configured~~ on one side of the planetary gear unit PU ~~for example~~, the construction of ^{the} ~~an~~ oil line (for example, 2a, 2b, 92, 93, 94) ^{which} ~~to~~ provide oil to the ~~oil~~ ^{hydraulic} pressure servos 11, 12, and 13 for these clutches C1, C2, C3 ~~can be made easily, and the manufacturing process can be~~ ^{is} simplified and the costs brought down.

Further, because the oil pressure servos 11 and 13 are provided on the input shaft 2, one set of seal rings 81 and 82 ^{provide a} ^{with} ^{connection} seal the case 3 and ~~supply oil~~ to the oil lines 2a, and 2b provided within input shaft 2, and therefore oil can be supplied to the oil compartment of ^{hydraulic} ~~oil pressure~~ servos 11 and 13 without providing seal rings between, for example, the input shaft 2 and the ^{hydraulic} ~~oil pressure~~ servos 11 and 13. Further, the ^{hydraulic} ~~oil pressure~~ servo 12 can supply oil from the boss ~~case~~ 3b ~~provided from the case 3~~, without passing through other units, ^{the oil} ~~for example, in other words, can supply~~

oil^V by providing one set of seal rings 83. Therefore, ^{the} oil supply ~~can be supplied~~ ^{connected} simply by providing one set of seal rings 81 and 82, 83 ^{respectively} ~~each~~ ^{hydraulic} for the oil pressure servos 11, 12, and 13, ~~and~~ sliding resistance from the seal rings can be minimized, and therefore the efficiency of the automatic transmission can be improved.

Further, ^{because} the clutch C1 ~~is a clutch that~~ engages at relatively slow to medium speed ^{i.e.} levels of first speed forward, second speed forward, third speed forward, and fourth speed forward, and ~~therefore then this clutch is~~ released ⁱⁿ at fifth speed forward, sixth speed forward, ^{and} or first speed reverse, which are relatively high speed ^{levels}, the hub unit 22 that connects ~~in particular this~~ clutch C1 and sun gear S2 rotates at a relatively high ^{speed} rotation or in reverse ^{because} rotation (see Fig. 3), and ~~on the other hand~~ the transmitting member 30 ^{rotates at} reduces speed rotation ⁱⁿ at fifth speed forward ^{and} of first speed reverse, ~~and~~ there may be cases wherein the transmitting member is fixed at sixth speed forward, and the ~~rotation~~ ^{in rotational speed} difference between the hub unit 22 and the transmitting member 30 may become large. However, because this clutch C1 is located on the ~~opposite~~ side of ^{opposite} the ^{first} planetary gear ^{unit} PR ~~and~~ ^{second} the planetary gear unit PU, the hub unit 22 and the transmitting member 30 can be ^{spaced} ~~configured~~ apart, and compared with the case wherein for example those units are ~~configured~~ ⁱⁿ in contact with a multi-axial

construction, ² ~~the~~ ⁱⁿ decreased efficiency of the automatic transmission resulting from ~~the~~ relative rotation occurring because of friction between those units can be ~~prevented~~ ^{avoided}.

Further, because the counter gear 5 is ~~configured in~~ ^{located} ~~the~~ ^{intermediate second} axial direction between the planetary gear unit PU and the planetary gear PR, the counter gear 5 can be ~~configured~~ ^{located} ~~in~~ ^{at} approximately the center in ~~the axial direction~~ ^{axial} of the automatic transmission. For example, when the automatic transmission is mounted on ~~the~~ ² vehicle, enlarging ~~towards~~ ^{event} ~~in one direction of the axis~~ ^{axial} (particularly ~~in the rear~~ ^{toward} direction when the input ~~side~~ from the drive source is ~~the~~ ² "front" ~~direction~~ ^{is not necessary} can be prevented because the counter gear 5 is mounted to ~~match~~ ^{adjoining} the drive wheel transmission mechanism. Because of this, particularly in the case of ~~an~~ ^{with} FF vehicle, ~~the~~ interference toward the front wheels is reduced, ~~and the~~ mountability on a vehicle can be improved, ~~such~~ ^{is} the steering angle being ~~greatly improved~~ ^{and} for example.

Further, ~~in the event that the oil pressure servo 13 is~~ ^{IF hydraulic} ~~located~~ ^{ing} ~~configured adjoined to the planetary gear PR for example,~~ ^{unit} and the hub unit 26 is made to be the cylinder ~~unit~~ ^{serve as} ~~for the~~ ^{of} ~~oil pressure servo 13,~~ ^{hydraulic} ~~the necessity arises~~ ^{it becomes necessary} to provide one set of seal rings between the hub ~~unit~~ 26 and the input shaft 2. However, the ~~oil pressure~~ ^{hydraulic} servo 13 of the clutch C3 is ~~configured~~ ^{located} on the ~~opposite~~ ^{axially opposite} side of the friction plates ~~73~~ ^{unit} from the planetary gear PR in the axial direction, ^{first}

~~therefore~~ seal rings are not ~~provided~~, ^{needed so that} in other words, the number of seal rings can be reduced, sliding resistance can be reduced, and by doing so, the efficiency of the automatic transmission can be improved.

Further, ^{because} the automatic transmission ~~device 14~~ ^{of} ~~according~~ ^{to the fourth} embodiment is a ~~transmission device that is~~ directly coupled ⁱⁿ at fourth speed forward. ~~Therefore,~~ ⁱⁿ at fifth speed forward, and ⁱⁿ sixth speed forward, the gear ratio can be ~~specified at~~ a high ratio, and particularly ~~when~~ mounted on a vehicle, in the event that the vehicle is running at a high ^{vehicle} speed, the engine ~~revolutions~~ ^{speed} can be lowered, and this contributes to the quietness of the vehicle ^{becomes more quiet} while running at a high speed.

~~In order to solve the above-described problems,~~
~~proposals have been made such as those in Japanese~~
~~Unexamined Patent Application Publication No. 8-68456~~ ^{proposes}
~~However, the product in this Publication has a construction~~
wherein a clutch is ^{located} ~~configured~~ on the line that transmits the reduced ^{speed} rotation of the reducing planetary gear ^{unit} to the ^{input rotary element} ~~rotation component~~ of the planetary gear ^{unit}, and because the ~~line that transmits~~ this reduced ^{speed} rotation is ~~a line~~ ^{transmitted} wherein a large torque is ~~input~~, the clutch or members that transmit the torque must be constructed so as to withstand this ^{high} ~~large~~ torque. In other words, the number of friction members on ^{the} a clutch must be increased, ~~the~~ the size thereof

increased, or the ~~oil pressure~~ ^{hydraulic} servo ~~for pressurizing~~ ^{which operates} the ~~friction member~~ ^{clutch} must be made larger. Further, because a brake must be ~~configured to retain~~ ^{provided stop} the ~~rotation~~ ^{rotary element} component of the ~~planetary gear unit~~ ^{front}, this automatic transmission was ~~insufficient with regard to being compact in size.~~

Therefore, ~~by~~ ^{unit} constructing a compact clutch and brake in the area of the reducing planetary gear, it is ~~an object of~~ the present embodiment ^{which is} to provide ^s an automatic transmission that ~~solves the above mentioned problems.~~ ^{more compact overall.}

~~Therefore, according to~~ ^{In} the automatic transmission ~~device 1, relating to the present embodiment,~~ ^{of this fourth} the clutch C3 is located between the input shaft 2 and the sun gear S1, and therefore, compared to ~~the case~~ ^{an embodiment} wherein the clutch C3 is located ~~for example~~ between the ring gear R1 and the sun gear S3, the ~~burden~~ ^{load} on the clutch C3 can be decreased, and the clutch C3 can be made more compact. Further, because the friction member and ~~oil pressure~~ ^{hydraulic} servo of the clutch C3 can be made smaller, they can be ~~configured on the inner~~ ^{located radially inward} ~~circumference side in the radial direction~~ of the brake B1, and the automatic transmission can be made more compact.

~~Now, the~~ ^{While the} first through fourth embodiments ^{as} relating to the present invention have been described ^{above} as being applicable to an automatic transmission ^s having a torque converter, ~~but should not be~~ ^{the invention is so} limited to this, and any motion starting device may be used that ~~would~~ ^s transmit the

embodiments have the transmission of the invention ^{the} torque (rotation) at ^{while the above-described} start of movement. Further, ~~a case~~ wherein this is mounted on a vehicle with an engine as a drive source ~~has been described~~, ^{the invention is so} but should not be limited ~~to this~~ ^{and} any drive source may be used as a matter of course. For example, ^{the transmission} ~~and this~~ may be mounted on a hybrid vehicle. Further, ^{while} the ^{described} above-mentioned automatic transmission is favorable ~~for~~ used in a FF vehicle, ^{it is} ~~but should not be~~ limited to this, and can be used in a FR vehicle, a four-wheel drive vehicle, or vehicles with other types of drive systems.

Further, the reducing ^(first) planetary gear ^{unit} according to the above first through fourth embodiments has been described as one that reduces rotation ¹ speed of the ring gear by fixing the carrier while inputting the rotation of the input shaft into the sun gear, ^{the invention is so} but ~~should not be~~ limited ~~to this~~, and may reduce rotation ² speed of the ring gear by fixing the sun gear while inputting the rotation of the input shaft into the carrier.

~~Industrial Applicability~~

As described above, the automatic transmission ^{can be advantageously} according to the present invention ~~is beneficial~~ mounted on vehicles such as automobiles, trucks, busses, and so forth, and is particularly suitable for use with vehicles which require ^a reduction in size and reduction in weight ^{of the transmission} ~~from~~ ^{for mounting on} ~~mountability~~ to the vehicle, and further require reduction

of speed change

in shock, ~~of changing speeds~~

ABSTRACT

^{first}
A planetary gear PR and a clutch C3 for outputting ^{unit}
^{speed} reduced rotation are ^{located} ^{axial} ^{second} configured on one side of a planetary gear unit PU ~~in the axial direction~~ ^{from} right side of the ~~diagram~~, and a clutch C1 for connecting and disconnecting the rotation of an input shaft 2 ~~input~~ to a sun gear S2 and a clutch C2 for connecting and disconnecting the rotation of the input shaft 2 ^{from} input to a carrier CR2 are ^{located} ^{second} configured on the other ^{axial} side ~~(left side of the diagram)~~ of the planetary gear unit PU. ~~in the axial direction~~ ^{mechanism} and an output member is ^{first and second} configured between said planetary gear unit ^S and reducing planetary gear and engaging means. By doing so, ^{located} ^{with a drive} ~~as compared~~ ^{train} to the case wherein the clutch C1 or clutch C2 is configured between ^{two} the planetary gear PR and the planetary gear unit PU, ^{units} the planetary gear PR and the planetary gear unit ^S PU can be ^{two} ^{located closer} configured close together, and a transmitting member 30 that transmits the reduced ^{speed} rotation ^{can be made} becomes shorter. Further, ^{a drive train} compared to the case wherein, ~~for example~~, the clutches C1, C2, C3 are ^{located} ^{axial} configured together on one side of the axial ^{supply to hydraulic servos can be} direction, the construction of an oil line is simplified.
